LIFELONG RESEARCH OBJECTIVE

My lifelong research objective is to bridge the gap between fundamental understanding of Large Language Models and their practical impact in the real world. I aim to develop AI systems that are not only capable, but also understandable, efficient, and practically deployable. Ultimately, I hope to contribute research that advances our understanding of how intelligent models work while translating these insights into technologies that can meaningfully benefit real-world applications and industry.

RESEARCH INTERESTS

My research philosophy is centered on practical and impact-driven research, with the goal of bridging fundamental understanding of Large Language Models and their real-world applications. I believe that building LLMs that are genuinely useful in practice requires understanding the entire model lifecycle, from their underlying mechanisms and learned behaviors to their optimization, deployment, and interaction with real-world systems. Accordingly, my research interests span LLM interpretability and behavioral analysis, efficient LLMs, and practical LLM systems. In particular, I am interested in understanding how model behaviors and capabilities emerge, leveraging these insights to develop more efficient models and inference methods, and ultimately translating such advances into reliable and scalable AI systems that can address real-world problems.
